The present invention relates to novel human lipid-associated molecules invention are useful for treating diseases or conditions associated with decreased expression of functional LIPAM. The antagonist is useful for treating a disease or condition associated with the overexpression of treating a disease or condition associated with the overexpression of treating a disease or condition associated with the overexpression of cardiovascular disorders (e.g. arteriovenous fistula, atherosclerosis, hypertension, Raynaud's disease, aneurysms, varicose veins, congestive beart failure, thrombophlebitis, angina pectoris, ischaemic heart disease or rheumatic heart disease), agstrointestinal disorders (e.g. peptic or rheumatic heart peptic ulcer or Crohn's disease), lipid metabolism disorders (e.g. fatty liver, Fabry's disease, Gaucher's disease, diabetes cesophagitis, nausea, peptic ulcer or Crohn's disease, diabetes consiliammatory disorders (e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's disease), neurological disorders (e.g. acquired immunodeficiency syndrome, critiammatory disorders (e.g. acquired immunodeficiency syndrome, critiametory disorders (e.g. acquired immunodeficiency syndrome, creutzfeldt-Jakob disease) or cancers (e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma or sarcoma). They are also used in gene therapy and protein replacement therapy. The present sequence is human or strong therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1074

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel human lipase (NHL; ABB09555, ABB09556) and to nucleic acids encoding it (AB077623, AB077624). The NHL has structural similarity with animal lipases, particularly phospholipase B. Polynucleorides encoding NHL were obtained using human genomic sequences in conjunction with human thyroid and brain cDNAs. The NHL gene is located on chromosome 2, and contains a C/T polymorphism at position 3953 located on chromism for the poper reading frame (ORF), resulting in an Ala/val substitution at position 1318 in the protein. NHL nucleotides and proteins are useful for treating disorders such as inflammatory or proliferative disease, infectious disease, clotting disorders, and cancer. They can also be used infectious disease, clotting disorders, and cancer. They can also

```
The present invention relates to novel human phospholipase-like enzymes and polynucleotides encoding such proteins. Sequences of the invention care useful for producing a medicament for modulating the activity of phospholipase in a disease such as cancer, inflammation, cardiovascular chaspease in a disease such as cancer, inflammation, cardiovascular disease, demortia disease, demortia disease, perkinson's disease, corticobasal degeneration, charbeimer's disease, Perkinson's disease, corticobasal degeneration, cardo mentia, schizophrenia with dementia, Korsakoff's psychosis, pain associated with CNS (e.g. epilepsy, failed back surgery syndrome, callergic disease including asthma, allergic rhinitis (hay fever), acopic dematitis, anaphylaxis and inflammation, cardiovascular disease, chronic dematitis, anaphylaxis and inflammation, cardiovascular disease, chronic constructive pulmonary disease, acute respiratory distress syndrome, gout, cattery disease, emphysema or obesity. They are also used for treating anorexia, overweight, cachexia, bullmia, hypertension, type-II diabetes, coronary artery disease, hyperlipidaemia, gall bladder disease, ostecarthritis, artery disease, hyperlipidaemia, gall bladder disease, ostecarthritis, colon cancer), thrombolytic disease, reduced fertility, polycystic colon cancer), thrombolytic disease, reduced fertility, polycystic charact hyperlipidaemia, shiperson, menstrual irregularity, human when heaven heaven.
anaphylaxis; inflammation; acute respiratory distress syndrome; diabetes;
                 chronic obstructive pulmonary disease; emphysema; obesity; anorexia; overweight; cachexia; bulimia; hypertension; coronary artery disease; type-II diabetes; hyperlipidaemia; gall bladder disease; osteoarthritis; gout; sleep apnoea; respiratory problem; polycystic ovarian syndrome; thrombolytic disease; reduced fertility; pregnancy; stress incontinence; hirsutism; menstrual irregularity; depression; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New human phospholipase-like enzyme polypeptide useful for screening agents, and in the treatment of cancer, inflammation, diabetes, obesity, a central nervous system disorder, or a cardiovascular disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 25; Fig 2; 144pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human phospholipase like enzyme
                                                                                                                                                                                                                                                                                                                                  09-OCT-2001; 2001WO-EP011641.

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive activity. Pharmaceutical compositions comprising the NOVX proteins or nucleic acid molecules or NOVX antibodies are useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g. cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma. The products of the invention can be used for gene therapy or in a vaccine. ABU65218 represent the NOVX polypeptides encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Spytek KA, Shenoy SG, Taupier RJ, Pena CEA, Li L;

New NOVX polypeptides and nucleic acid molecules useful for preventing or treating NOVX-associated disorders, e.g. cancer, cardiomyopathy, atherosclerosis or diabetes, in chromosome mapping, tissue typing or in pharmacogenomics.

Claim 2; SEQ ID NO 984; 1503pp; English.

The invention relates to 566 new isolated human polypeptides and their

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences comprising one or more conservative substitutions in these. The polypeptide, polynucleotide and antibodies against the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Alzheimer's disease, Parkinson's disease, asthma, or fertility disorders. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The polypeptides are also useful as vaccines. This sequence represents an example of the polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         148

The invention relates to an isolated polypoptide (designated NOVX, or NOV1-NOV127) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also acid sequences (and their mature forms, variants and fragments). Also cincluded are an isolated nucleic acid molecule encoding Novx, a vector comprising the nucleic acid, a cell comprising the vector, methods for comprising the presence or amount of the polypeptide or the nucleic acid molecule in a sample, methods for determining the presence of expression of the above polypeptide or nucleic acid molecule in a first mammalian of the above polypeptide or nucleic acid molecule in a first mammalian of the above polypeptide or nucleic acid molecule in a first mammalian of subject, a method for identifying an agent that binds to the above subject, a method for identifying an agent that binds to the above cuse in the treatment of a pathology that is related to aberrant or a modulator of a modulations of the polypeptide and a method for identifying a ctivity or of latency or predisposition to a pathology associated with the polypeptide and a method for modulating consequence in the treatment of a modulation of a pathology associated with the polypeptide and a method for modulating consequence, obesity, infectious diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders like Alzheimer's disease or pathoneous mapping, tissue typing, preventive medicine and achoremacogenomics. The polypeptides are also useful as vaccines. The present sequence represents a NoVX protein of the invention. New NOVX polypeptides and nucleic acid molecules useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or Li, R, Spytek KA, Shenoy SG, Taupier RJ, Pena CEA, Li Gusev VY, Ji W, Gorman L, Miller CE, Kekuda R; Gangolli BA, Verriet CAM, Guo XS, Tchernev VT; Casman SJ, Malyankar UW, Gerlach V, Liu Y; Spaderna SK, Catterton E, Leite MW, Zhong H; Lepley DM, Rieger DK, Burgess CE; Claim 1; SEQ ID NO 86; 786pp; English. NOVX polypeptides and polynucleotides, useful for preventing or treating a disorder associated with aberrant NOVX expression or activity e.g., cancer, hypertension, atherosclerosis, cardiomyopathy or bronchial asthma.

Claim 1; Page 168-169; 1103pp; English.

This invention describes novel human NOVX polypeptides which have cytostatic, cardiant, antiarteriosclerotic, antiasthmatic and hypotensive

                           01-JUL-2004
                                                                                                                                                                                    04-MAR-2004
   ADN61813;
   The invention relates to 566 new isolated human polypeptides and their encoding genes, sequences that are at least 95% identical to these or sequences comprising one or more conservative substitutions in these. The polypeptide, polymucleotide and antibodies against the polypeptides are useful in diagnosing, treating or preventing NOVX-associated disorders, e.g. cardiomyopathy, atherosclerosis, hypertension, cancer, obesity, diabetes, AIDS, multiple sclerosis, graft-versus-host disease, Parkinson's disease, asthma, or fertility disorders. Alzheimer's disease, Parkinson's disease, asthma, or fertility disorders. The nucleic acids are further used as hybridization probes, in chromosome mapping, tissue typing, preventive medicine, and pharmacogenomics. The example of the polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                       ŝ

New NOVX polypeptides and nucleic acid molecules useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. cancer, diabetes, infection or obesity, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; SEQ ID NO 82; 786pp; English.

The invention relates to an isolated polypeptide (designated NOVX, or NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino NOVI-NOVI27) comprising a sequence selected from 178 fully defined amino acid sequences (and their mature forms, variants and fragments). Also included are an isolated nucleic acid molecule encoding NOVX, a vector comprising the nucleic acid, a call comprising the vector, methods for comprising the presence of amount of the polypeptide or the nucleic acid determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian of the above polypeptide or identifying an agent that binds to the above polypeptide, a method for identifying a potential therapeutic agent for polypeptide, a method for identifying a potential therapeutic agent for use in the treatment of a pathology that is related to aberrant capturession or physiological interactions of the polypeptide, a method of screening for a medulator of activity or of latency or predisposition to screening to a pathology associated with the polypeptide and a method for modulating

the activity of the polypeptide cited above. The composition and method are useful for diagnosing, preventing or treating diseases such as diabetes, obesity, infectious diseases, anorexia, cancer-associated cachexia, cancer, neurodegenerative disorders like Alzheimer's disease, parkinson's disease, immune disorders, haematopoietic disorders, dyslipidaemias, and other chronic diseases. These may also be used in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The polypeptides are also useful as vaccines. The present sequence represents a NOVX protein of the invention.

This invention relates to novel human lipid-associated molecules (LIPAM)
and the DNA sequences which encode them. The invention may be useful for
the production of compounds with a neuroprotective, relaxant,
antithyroid, antidabetic, cytostatic, dermatological, immunosuppressive,
antinflammatory, thyromimetic, antiallergic, cerebroprotective,
cantinflammatory, thyromimetic, antiallergic, cerebroprotective,
cantinflammatory, thyromimetic, antiallergic, cerebroprotective,
antiparkinsonian, antibacterial, antiallergic, fungicide, protozoacide,
cyllocide, uropathic, antirheumatic, cardiant, cardiovascular, anti-HIV or
contropic activity acting as LIPAM agonists or antagonists. In addition,
the disclosed sequences may be useful for gene therapy. The invention may
contropic activity acting as LIPAM agonists or antagonists. In addition,
the disclosed sequences may be useful for gene therapy. The invention may
contropic activity acting as LIPAM, agonists or addition,
the disclosed sequences may be useful for general addition,
the abnormal expression or activity of LIPAM, such as
with an abnormal expression or activity of LIPAM, such as
confocular disorders (for example Parkinson's disease), cancers (for
example leukaemia, cervical or breast cancers), immunological disorders
(for example scleroderma, systemic lupus erythematosus, allergies),
casample allergic and sorders (for example Crohn's disease), renal disorders
(for example Goodpasture's syndrome), infections (for example
casample doodpasture's syndrome), infections
cirrhosis). LIPAM or its fragments may also be used in screening for
compounds that specifically bind to and modulate the activity of LIPAM.
The polynucleotides can be used to create humanised animals or transgenic
compounds
condel human disease. The present sequence is that of a human
continued that present example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       , Elliott VS;

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                 1 MRELVGSGRYDTQEDFSVVL......RCRRGGRREDPPMSLRTVAL 472
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 3

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO ACINETOBACTER
TITLE OF INVENTION: BAUMANNII FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERBNCE: GTC99-03PA
CURRENT APPLICATION NUMBER: US/09/328,352
CURRENT FILING DATE: 1999-06-04
NUMBER OF SEQ ID NOS: 8252
SEQ ID NO 7914
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     22;

Sequence 5416, Application US/10369493

Publication No. US20030233675A1

GENERAL INFORMATION:

APPLICANT: Color, Yonger

APPLICANT: Slater, Steven C.

APPLICANT: Goldman, Barry S.

TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF TITLE OF INVENTION: PLANTS WITH IMPROVED PROPERTIES

TITLE OF INVENTION: EXPRESSION OF MICROBIAL PROTEINS IN PLANTS FOR PRODUCTION OF FILE REFERENCE: 38-10 (52052)

CURRENT APPLICANTON NUMBER: US/10/369,493

CURRENT FILING DATE: 2003-02-28

PRIOR APPLICANTON NUMBER: US 60/360,039

PRIOR PRILING DATE: 2002-02-21

NUMBER OF SEQ ID NOS: 47374
